June 27, 2026

I examined five datasets for this project. I rejected that Amazon dataset. It has only 1400 rows. This size breaks one rule. I rejected those Steam and YouTube datasets. They have too many rows and complex text files. I work alone, so I need to save time. I rejected that S&P 500 dataset. Financial numbers are bad to balance classes. I chose this Ames Housing Dataset. This data has 2930 rows and 79 features. This size matches every rule.

<https://www.kaggle.com/datasets/shashanknecrothapa/ames-housing-dataset/data>

This data will be split: 70% to train and 30% to test. I will do EDA only on training data.

1. I plan to prepare this data with basic methods from our labs:
2. Filling NaN and Null: Empty cells will be filled with median numbers.
3. Feature Engineering: I want to create one new feature to show house age.
4. Scaling and Normalization: I need to change ranges for big area numbers. I will also adjust distribution shapes for house prices.
5. Encoding and One-Hot encoding: Text categories will be converted to numbers. I will create binary columns for neighborhoods.
6. Class Balancing: Target prices will become one binary category. I plan to balance these classes.
